## 1. CIRP Construct Mean Reports

How to Read the CIRP Construct Mean Reports
a. Habits of Mind 1 A
b. Academic Self-Concept
c. Social Self-Concept 1 1C
d. Pluralistic Orientation
e. Social Agency
f. Civic Engagement
g. College Reputation Orientation
h. Likelihood of College Involvement $\quad \frac{1 \mathrm{H}}{1 \mathrm{H}}$
2. CIRP Construct Percentage Reports

How to Read the CIRP Construct Percentage Reports
a. Habits of Mind $\quad \underline{2 A}$
b. Academic Self-Concept $\underline{2 B}$
c. Social Self-Concept

2 C
d. Pluralistic Orientation

2D
e. Social Agency
$\stackrel{2 \mathrm{E}}{2}$
f. Civic Engagement 2F
g. College Reputation Orientation

CIRP Construct Definition Summarizes the theoretical rationale for creating the construct.

Standard Deviation - Measure the variability around the mean. A small standard deviation indicates that the responses for the construct tend to be very close to the mean, whereas a large standard deviation indicates that the responses are spread over a larger range of response options.

Statistical Significance - Uses -test to examine the difference between the mean construct score for your institution and the comparison group. Constructs with mean differences that are larger than would be expected by chance are noted with one, two, or three stars, which correspond to the three standard levels of significance ( ${ }^{*} \mathrm{p}<.05$, ${ }^{* *} p<.01$, and ${ }^{* * *} p<.001$ ). Statistical significance measures the extent to which a difference is occurring by chance, not the extent to which a difference is practically important. Large sample sizes (like those in the comparison groups) tend to generate statistical significance even though the magnitude of the difference may be small and not practically significant. In order to provide additional context to statistical significance, effect sizes are provided.

CIRP Constructs are designed to capture the experiences and outcomes institutions are often interested in understanding, but that present a measurement challenge because of their complex and multifaceted nature. To measure these broad underlying areas more precisely, we use Item Response Theory (IRT) to combine individual survey items into global measures that capture these areas. CIRP Constructs are more than a summation of related items; IRT uses response patterns to derive construct score estimates while simultaneously giving greater weight in the estimation process to survey items that tap into the construct more directly. This results in more accurate construct scores. Constructs are particularly useful for benchmarking. They allow you to determine if the experiences and outcomes for your students differ from your comparison groups. Two reports are generated for each CIRP Construct. The Mean Score Report shows comparative information based on the mean score of a construct. The Percentage Report shows comparative information based on the percentage of students who score in the high, average, and low score groups of a construct. We suggest you use the report that best fits your needs as an institution. Both CIRP Construct reports are generated for first-time, full-time freshman, which we define as those respondents who first entered college in 2012 and are currently enrolled full-time.
For more information about IRT and the CIRP Construct development process, see the CIRP Constructs Technical Report at www.heri.ucla.edu

Survey items and estimation 'weights'
Rate yourself on each of the following traits as compared with the average person your age:
*Academic ability (3.52)
*Self-confidence - intellectual (1.22)

* Drive to achieve (0.95)
* Mathematical ability (1.22)

Survey Items and Estimation "Weights" - The survey items used in the creation of the CIRP Construct are presented in the order in which they contribute to the construct along with the estimation weights generated in IRT. Items that tap into a trait more effectively are given greater weight in the estimation process.

Charts - Provide a visual display of relevant construct scores for your institution and two comparison groups. The $Y$ axis is defined by the highest and lowest possible construct score. Mean scores are represented by blue circles. The numbers at the top and bottom of the vertical line are values for the 75th and 25th percentiles.

Comp 1 - The first
comparison group is based on your institution's type, control, and selectivity.

Comp 2 - The second comparison group is based on your institution's type and control.

Mean - The arithmetic mean is computed for each CIRP Construct based on the construct score. CIRP Constructs are scored on a zscore metric and rescaled for a mean of approximately 50 and standard deviation of 10.

Effect Size - Determines the practical significance of the mean difference between your institution and the comparison group. It is calculated by dividing the mean difference by the standard deviation of the comparison group. Generally, an effect size of . 2 is considered small, .5 medium, and .8 large. A positive sign indicates that your institution's mean is greater than the mean of the comparison group; a negative sign indicates your mean is smaller than the mean of the comparison group.

## Survey items and estimation 'weights':

What is your best guess as to the chances that you will:

* Participate in student clubs/groups (3.25)
* Participate in volunteer or community service work (1.58)
* Socialize with someone of another racial/ethnic group (1.28)
* Participate in a study abroad program (1.24)
* Participate in student government (0.96)

CIRP Constructs are designed to capture the experiences and outcomes institutions are often interested in understanding, but that present a measurement challenge because of their complex and multifaceted nature. To measure these broad underlying areas more precisely, we use Item Response Theory (IRT) to combine individual survey items into global measures that capture these areas. CIRP Constructs are more than a summation of related items; IRT uses response patterns to derive construct score estimates while simultaneously giving greater weight in the estimation process to survey items that tap into the construct more directly. This results in more accurate construct scores. Constructs are particularly useful for benchmarking. They allow you to determine if the experiences and outcomes for your students differ from your comparison groups. Two reports are generated for each CIRP Construct. The Mean Score Report shows comparative information based on the mean score of a construct. The Percentage Report shows comparative information based on the percentage of students who score in the high, average, and low score groups of a construct. We suggest you use the report that best fits your needs as an institution. Both CIRP Construct reports are generated for first-time, full-time freshman, which
we define as those respondents who first entered college in 2012 and are currently enrolled full-time.
For more information about IRT and the CIRP Construct development process, see the CIRP Constructs Technical Report at www.heri.ucla.edu

Survey items and estimation 'weights'
Rate yourself on each of the following traits as compared with the average person your age:
*Academic ability (3.52)
*Self-confidence - intellectual (1.22)

* Drive to achieve (0.95)
*Mathematical ability (1.32)

Survey Items and Estimation "Weights" - The survey items used in the creation of the CIRP Construct are presented in the order in which they contribute to the construct along with the estimation weights generated in IRT. Items that tap into a trait more effectively are given greater weight in the estimation process.

Charts - CIRP Constructs are scored on a z-score metric and rescaled for a mean of approximately 50 and standard deviation of 10 . The Low, Average, and High construct score group percentages are reported here. The "Low" score group represents students who are one-half standard deviation below the mean. The "Average" score group represents students whose scores are within one-half standard deviation of the mean. The "High" score group represents students who are one-half standard deviation or more above the mean.

CIRP Construct Definition Summarizes the theoretical rationale for creating the construct.

Comp 1 - The first comparison group is based on your institution's type, control, and selectivity.

Comp 2 - The second comparison group is based on your institution's type and control.

Statistical Significance - uses a proportional difference test to examine the difference between the percentage of students in the high score group for your institution and the percentage of students in the high score group in the comparison group. Differences larger than what would be expected by chance are noted with one, two, or three stars, which correspond to the three standard levels of significance ( ${ }^{*} \mathrm{p}<.05$, ${ }^{* *} \mathrm{p}<.01$, $* * * \ll .001$ ). Statistical significance measures the extent to which a difference is occurring by chance, not the extent to which a difference is practically important. Large sample sizes (like those in the comparison groups) tend to generate statistical significance even though the magnitude of the difference might be small and not practically important. Unlike the means scores report, in this case there are no effect size calculations to guide you in determining practical importance when comparing proportional differences.
